

## Motivation

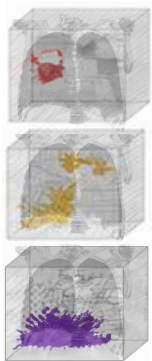

**Sparse Visual Evidence** **vs.** **Dense Language Semantics**

Key organs (e.g., **lungs**, **heart**) occupy only a Tiny Portion of voxels

## Challenge

A. Sentence-level semantics are diverse and weakly grounded

Atelectasis changes, small consolidation area and slightly budding tree images are observed in the left upper lobe.  
There are slightly patchy ground glass densities in the superior lingula of the right lung upper lobe. Heart contour and size are natural.

B. Open-vocabulary report challenges finding correct spatial correspondences.

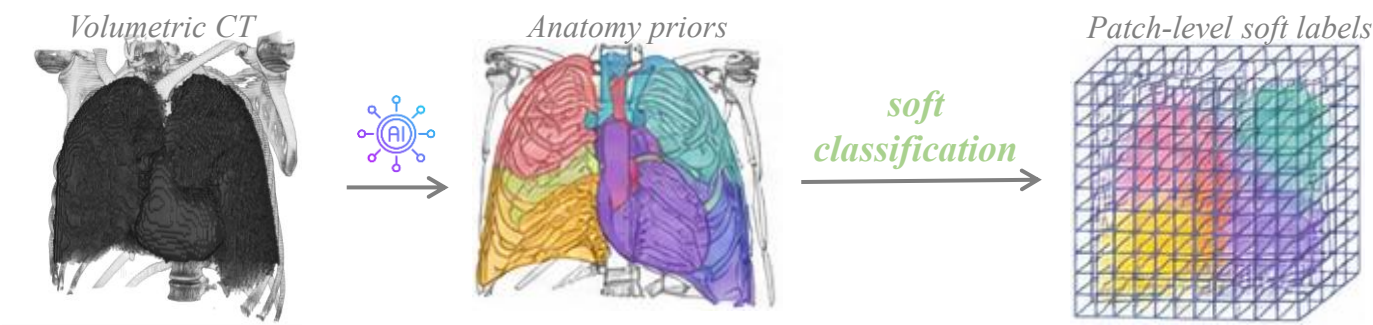

How to design Med-VLP method, enabling **anatomy-aware** and **semantically precise** representation learning?

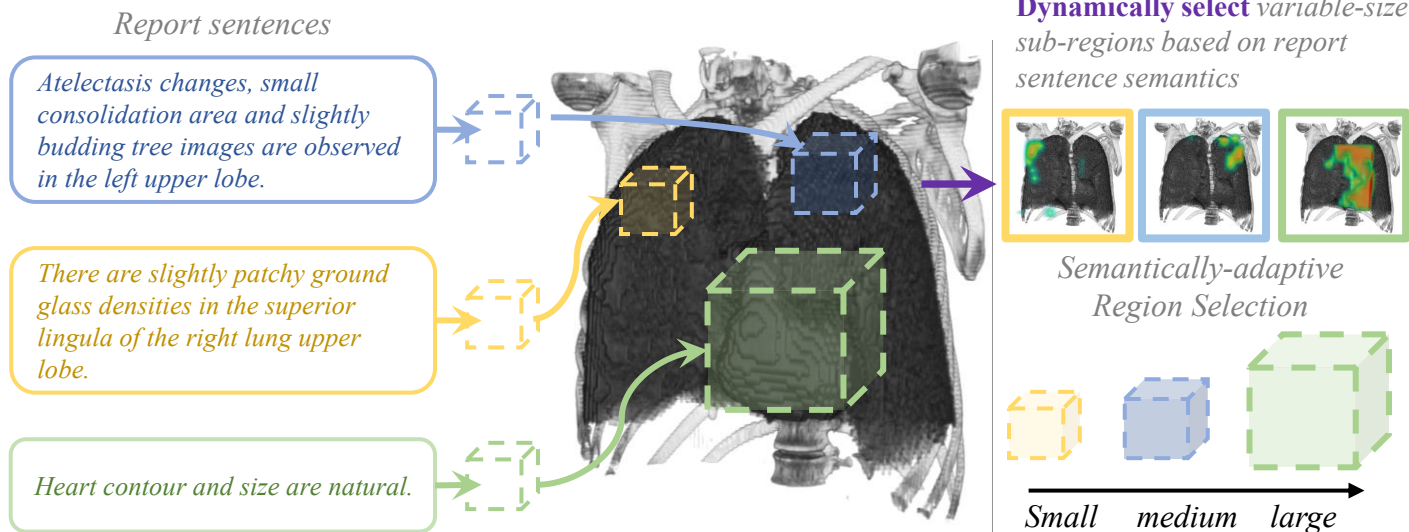

## Our Method: ASAP

(Anatomical-aware Semantically-Adaptive Pre-training)

### 1. Anatomy-aware Knowledge Injection

### 2. Semantically-adaptive Selective Alignment

## Comprehensive Benchmark
