- I. Stochastic Programming**
- II. Object Oriented GAMS API**

# I. Stochastic Programming

# AML and Stochastic Programming (SP)

- Algebraic Modeling Languages/Systems good way to represent optimization problems
  - Algebra is a universal language
  - Hassle free use of optimization solvers
  - Simple connection to data sources (DB, Spreadsheets, ...) and analytic engines (GIS, Charting, ...)
- Large number of (deterministic) models in production
  - Opportunity for *seamless* introduction of new technology like Global Optimization, Stochastic Programming, ...
  - AML potential framework for SP

2010

# Simple Example

# Simple Example: Newsboy (NB) Problem

- Data:
  - A newsboy faces a certain demand for newspapers  
 $d = 45$
  - He can buy newspapers for fixed costs per unit  
 $c = 30$
  - He can sell newspapers for a fixed price  
 $r = 60$
  - For hold units he has to pay a disposal fee  
 $h = 10$
  - He has to satisfy his customers demand or has to pay a penalty  
 $p = 5$

- Decisions:
  - How many newspapers should he buy: X 45
  - How many newspapers should he sell: S 45
- Derived Outcomes:
  - How many newspapers need to be disposed: I 0
  - How many customers are lost: L 0

## Simple NB Problem – GAMS Formulation

```
*          LostSales = demand - UnitsSold  
lSales..  L =e= d - S;
```

```
*          Inventory = UnitsBought - UnitsSold  
Inv..    I =e= X - S;
```

```
*          Profit, to be maximized  
Profit..  Z =e= r*S - c*X - h*I - p*L;
```

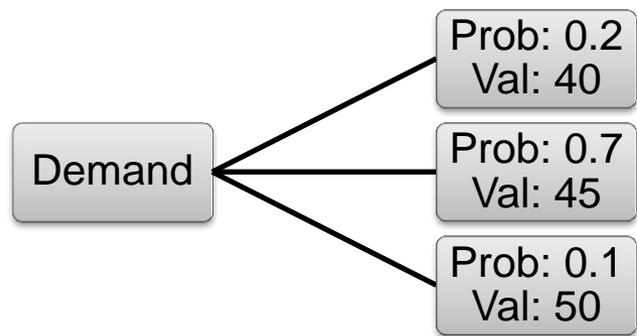

```
Model nb / all /;
```

```
solve nb max z use lp;
```

# NB Problem – Add Uncertainty

- Uncertain demand  $d$

- Decisions to make:
  - How much newspaper should he buy “here and now” (without knowing the outcome of the uncertain demand)?
    - *First-stage decision*
  - How many customers are lost after the outcome becomes known?
    - *Second-stage or recourse decision*
  - Recourse decisions can be seen as
    - penalties for bad first-stage decisions
    - variables to keep the problem feasible

# Stochastic NB Problem – GAMS Extension

\* Make d uncertain

```
randvar d discrete 0.2 40  
0.7 45  
0.1 50
```

\* Define non-default stages

```
stage 2 d I L S  
stage 2 lSales Inv
```

# **New GAMS (EMP) Keywords**

## Excursus: EMP, what?

With new modeling and solution concepts do not:

- overload existing GAMS notation right away !
- attempt to build new solvers right away !

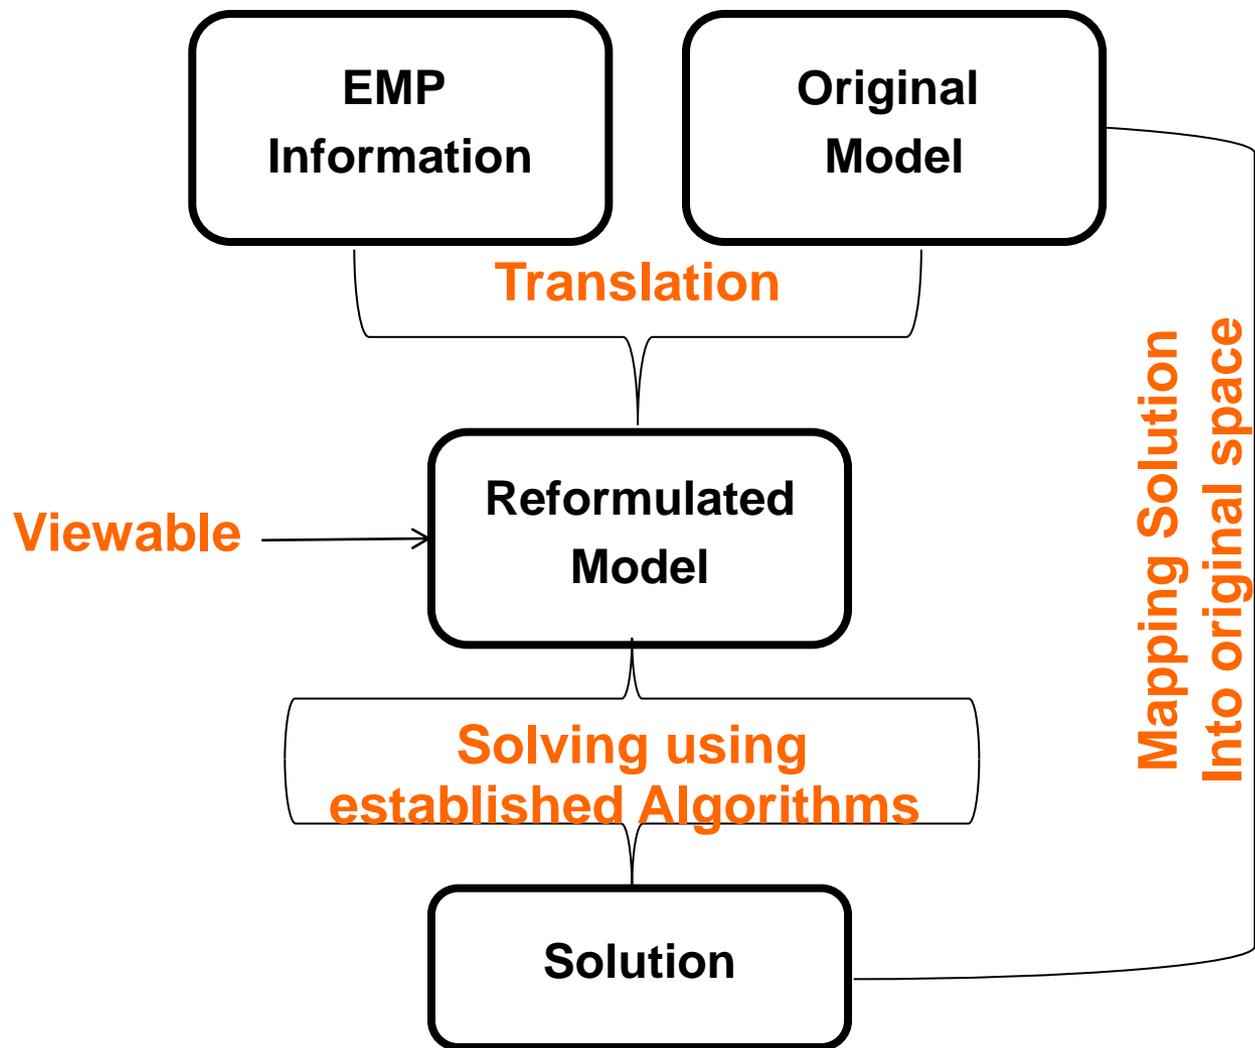

But:

- Use existing language features to specify additional model features, structure, and semantics
- Express extended model in symbolic (source) form and apply existing modeling/solution technology
- Package new tools with the production system

**→ Extended Mathematical Programming (EMP)**

# JAMS: a GAMS EMP Solver

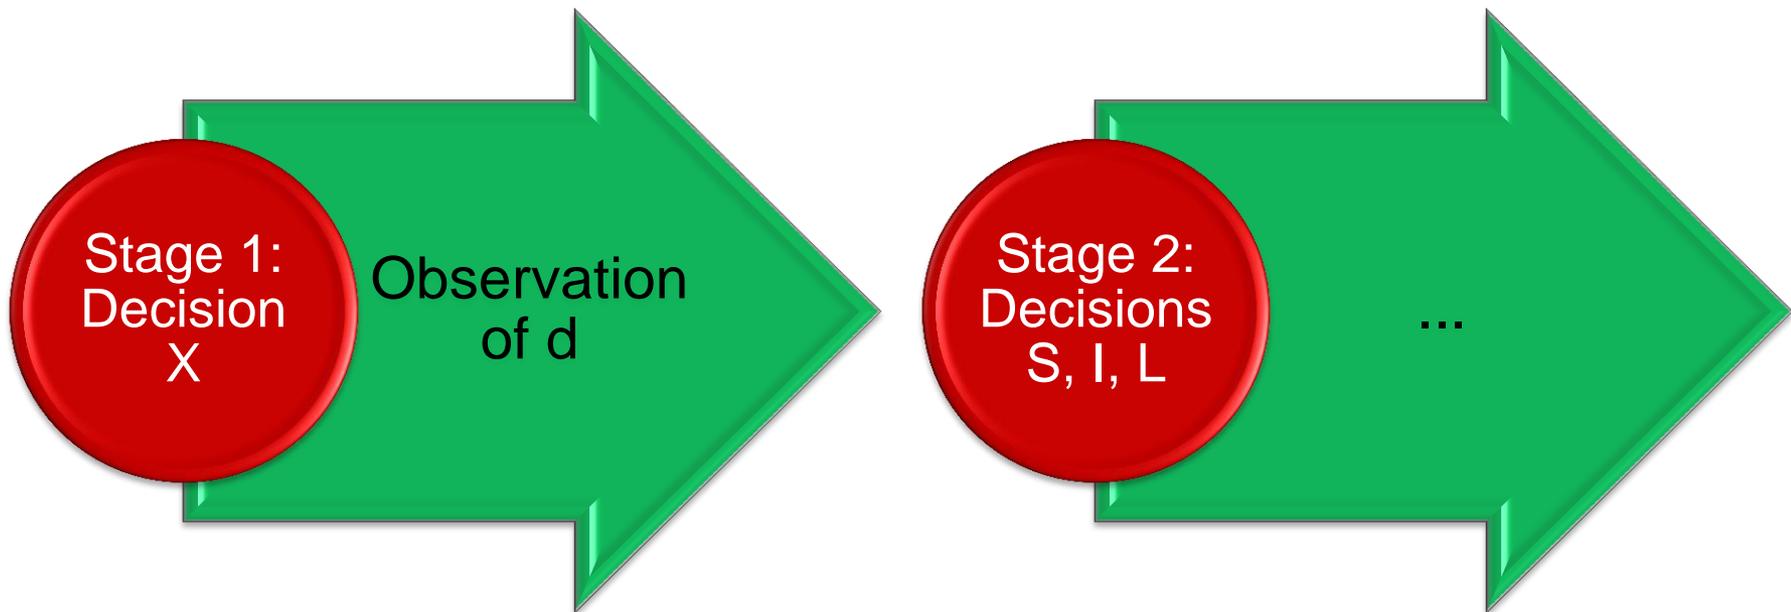

# Output Extraction

- The expected value of the solution can be accessed via the regular `.L` and `.M` fields
- In addition, the following information can be stored in a parameter by scenario:
  - `level`: Levels of variables or equations
  - `marginal`: Marginals of variables or equations
  - `randvar`: Realization of a random variable
  - `opt`: Probability of each scenario
- This needs to be stored in a separate dictionary:

```
Set dict / scen.scenario .'  
      x   .level         .s_x  
      ''  .opt           .srep /;
```

# Stages

## Stages [stage]

- Defines the stage of random variables (`rv`), equations (`equ`) and variables (`var`):

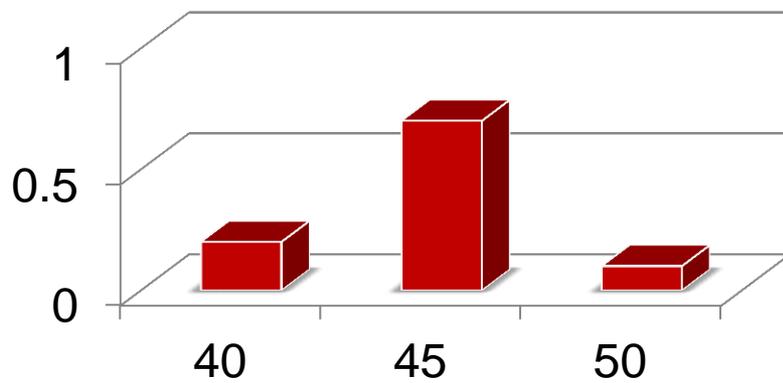

```
stage stageNo rv | equ | var {rv | equ | var}
```

- `StageNo` defines the stage number
- The default `StageNo` for the objective variable and objective equation is the highest stage mentioned
- The default `StageNo` for all the other random variables, equations and variables not mentioned is 1

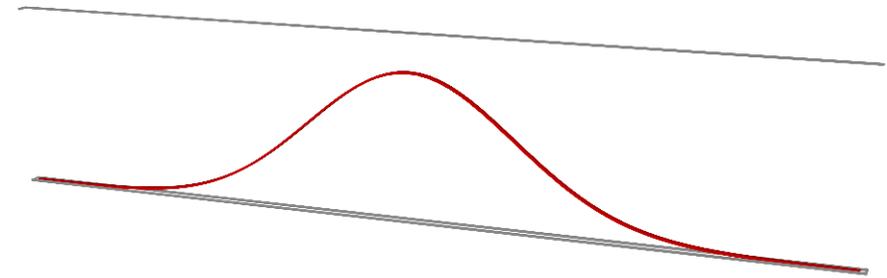

# Random Variables

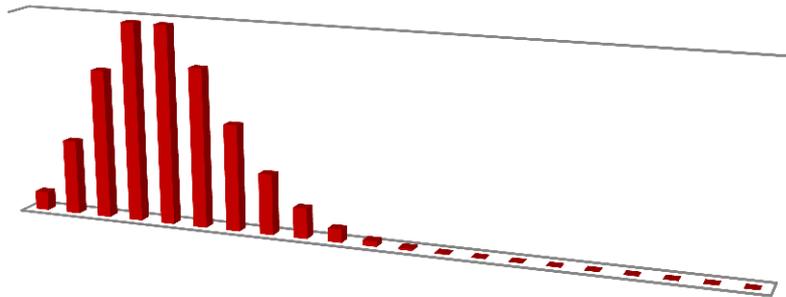

## Discrete Distribution

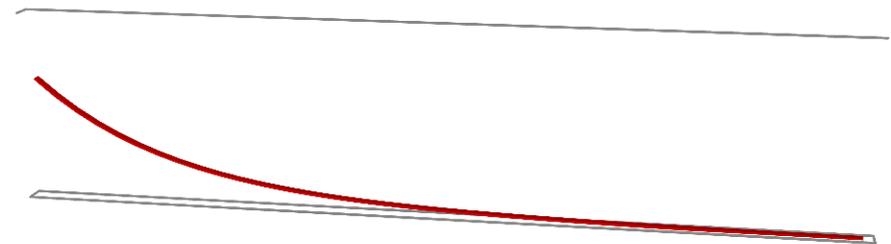

## Normal Distribution

## Poisson Distribution

## Exponential Distribution

# Random Variables (RV) [`randVar`]

- Defines both discrete and parametric random variables:

```
randVar rv discrete prob val {prob val}
```

- The distribution of discrete random variables is defined by pairs of the probability `prob` of an outcome and the corresponding realization `val`

→ [nbdiscindep.gms](#)

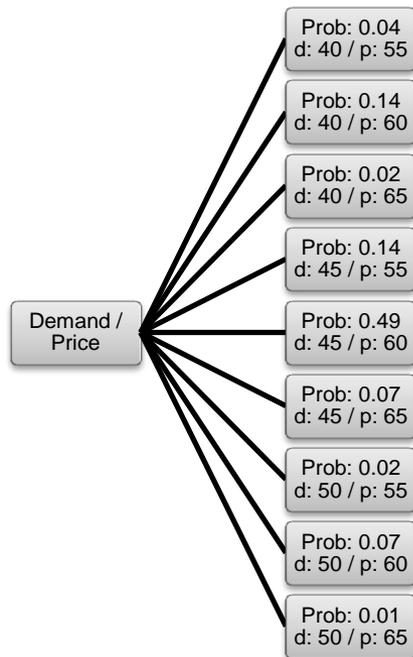

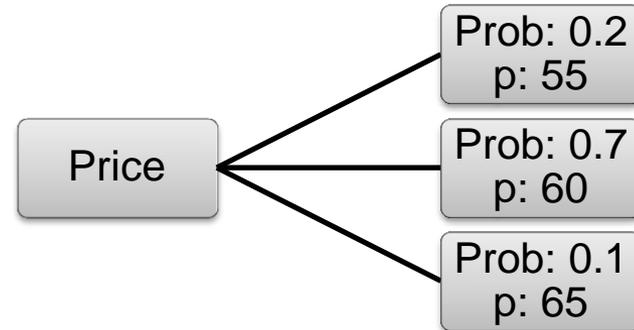

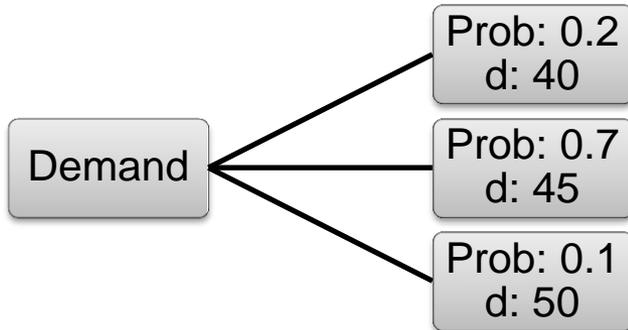

```
randVar rv distr par {par}
```

- The name of the parametric distribution is defined by `distr`, `par` defines a parameter of the distribution

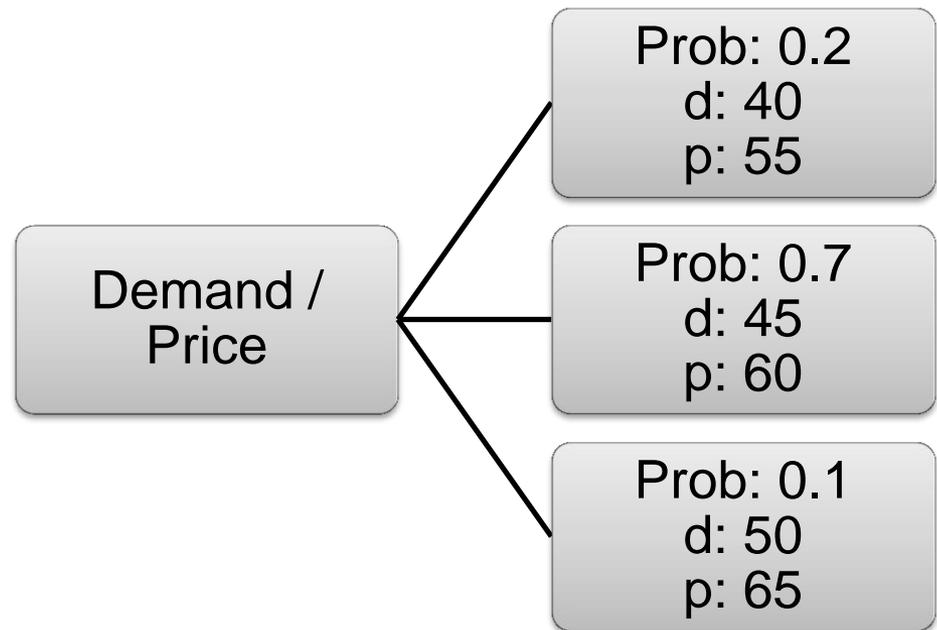

→ [nbcontindep.gms](#)

# Joint Random Variables

**vs.**

## Joint RVs [jRandVar]

- Defines discrete random variables and their joint distribution:

```
jRandVar rv rv {rv} prob val val {val}  
          {prob val val {val}}
```

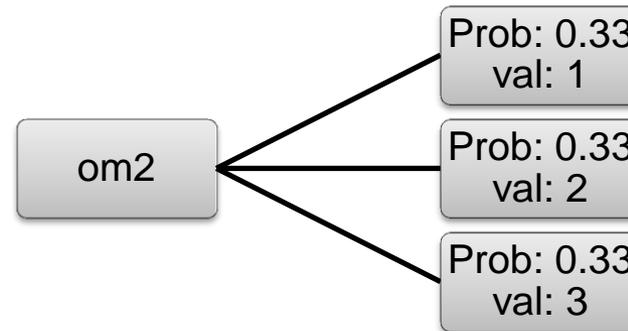

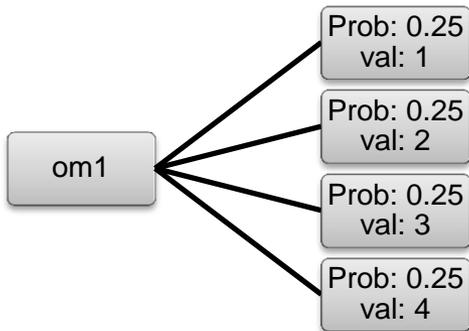

- At least two discrete random variables `rv` are defined and the outcome of those is coupled
- The probability of the outcomes is defined by `prob` and the corresponding realization for each random variable by `val`

→ [nbdiscjoint.gms](#)

# Chance Constraints

```
OBJ.. Z =e= X1 + X2;  
E1.. om1*X1 + X2 =g= 7;  
E2.. om2*X1 + 3*X2 =g= 12;  
Model sc / all /;  
solve sc min z use lp;
```

```
chance E1 0.6  
chance E2 0.6
```

# Chance Constraints

3 out of 4  
must be true  
[ $0.75 \geq 0.6$ ]

- $1 * X1 + X2 = g = 7;$
- $2 * X1 + X2 = g = 7;$
- $3 * X1 + X2 = g = 7;$
- $4 * X1 + X2 = g = 7;$

2 out of 3  
must be true  
[ $0.66 \geq 0.6$ ]

- $1 * X1 + 3 * X2 = g = 12;$
- $2 * X1 + 3 * X2 = g = 12;$
- $3 * X1 + 3 * X2 = g = 12;$

# Chance Constraints [chance]

- Defines individual or joint chance constraints (CC):

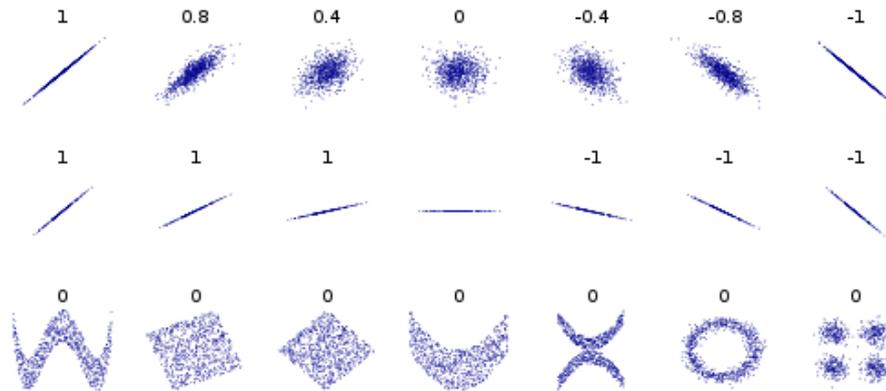

```
chance equ {equ} [holds] minRatio [weight|varName]
```

- Individual CC: A single constraint `equ` has to hold for a certain ratio ( $0 \leq \text{minRatio} \leq 1$ ) of the possible outcomes
- Joint CC: A set of constraints `equ` has to hold for a certain ratio ( $0 \leq \text{minRatio} \leq 1$ ) of the possible outcomes
- If `weight` is defined, the violation of a CC gets penalized in the objective (weight violationRatio)
- If `varName` is defined the violation get multiplied by this existing variable

→ [simplechance.gms](#)

# Correlation between RVs [correlation]

Source:  
Wikipedia

- Defines a correlation between a pair of random variables:

```
correlation rv rv val
```

- `rv` is a random variable which needs to be specified using the `randvar` keyword and `val` defines the desired correlation ( $-1 \leq val \leq 1$ )

→ [nbcontjoint.gms](#)

# Adding Uncertainty to Transport

```
...  
Model transport /all/ ;  
  
file emp / '%emp.info%' /; put emp '* problem %gams.i%'/;  
$onput  
randvar b('new-york') normal 325 50  
randvar b('chicago') normal 300 50  
randvar b('topeka') normal 275 50  
stage 2 b demand  
$offput  
putclose emp;  
  
Set scen scenarios / s1*s6 /;  
Parameter  
s_b(scen,j) demand realization by scenario  
s_x(scen,i,j) shipment per scenario  
s_s(scen) ;  
  
Set dict / scen .scenario.'  
b .randvar .s_b  
x .level .s_x /;  
  
Solve transport using emp minimizing z scenario dict;
```

# Summary

# Available GAMS SP Solvers

	<b>DE</b>	<b>DECIS</b>	<b>LINDO</b>
chance	✓		✓
correlation			✓
jrandvar	✓	✓	✓
randvar (discrete)	✓	✓	✓
randvar (parametric)			✓

# Conclusion

- Deterministic examples from all kind of application areas exist already (e.g. ~400 in the GAMS Model Library)
- Easy to add uncertainty to existing deterministic models, to
  - ... either use specialized algorithms (DECIS, LINDO)
  - ... or create Deterministic Equivalent and select from wide range of existing GAMS solver links (DE, free)
- New SP examples in the GAMS EMP Library
- More work to be done:
  - Scenario tree support
  - Sampling
  - ...

## **II. Object Oriented GAMS API**

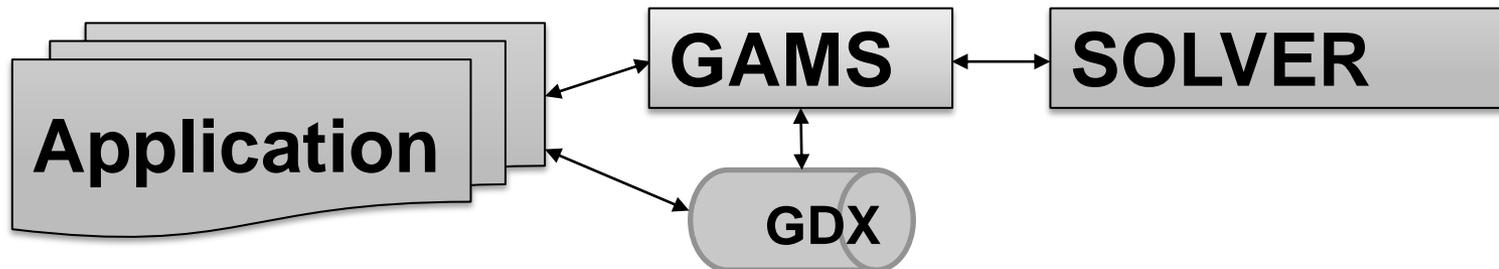

# Outline

- Introduction
- Development of a small GUI Application in C#

# Calling GAMS from your Application

## Creating Input for GAMS Model

→ Data handling using GDX API

## Callout to GAMS

→ GAMS option settings using Option API

→ Starting GAMS using GAMS API

## Reading Solution from GAMS Model

→ Data handling using GDX API

## Low level APIs → Object Oriented API

- Low level APIs
  - GDX, OPT, GAMSX, GMO, ...
  - High performance and flexibility
  - Automatically generated imperative APIs for several languages (C, Delphi, Java, Python, C#, ...)
- Object Oriented GAMS API
  - Additional layer on top of the low level APIs
  - Object Oriented
  - Written by hand to meet the specific requirements of different Object Oriented languages

## Features of the object oriented API

- No modeling capability. Model is still written in GAMS
  - Prepare input data and retrieve results in a convenient way  
→ *GAMSDatabase*
  - Control GAMS execution → *GAMSJob*
  - Seamless integration of GAMS into other programming environments
- .NET API and several examples are part of the current GAMS release available at [www.gams.com](http://www.gams.com)

# Transport Application

- Scenario solves of the transportation problem (mutable scalar)
- Features:
  - Preparation of input data
  - Loading data from Access file
  - Solving multiple scenarios of a model
  - Displaying results

# A Transportation Model

# Summary

- Object Oriented API provides an additional abstraction layer of the low level GAMS APIs
- Powerful and convenient link to other programming languages
- .NET API is part of the current GAMS release available at [www.gams.com](http://www.gams.com). Many examples available:
  - Sequence of Transport examples
  - Cutstock, Warehouse, Benders Decomposition
- Python and Java under development.
